brian@braverock.com

R/Rmetrics User and Developer Workshop, 2007

Outline

Introduction

Set Up Performance Analytics

Review Performance

Summary

Overview

- ▶ Utilize charts and tables to display and analyze data:
 - ▶ asset returns
 - ▶ compare an asset to other similar assets
 - ▶ compare an asset to one or more benchmarks
- ▶ Utilize common performance and risk measures to aid the investment decision
- ▶ Examples developed using data for six (hypothetical) managers, a peer index, and an asset class index
- ▶ Hypothetical manager data developed from real manager timeseries using *accuracy* and *perturb* packages to perturb data maintaining the statistical distribution properties of the original data.

Install PerformanceAnalytics.

- ▶ As of version 0.9.4, PerformanceAnalytics is available in CRAN
- ▶ Version 0.9.5 was released at the beginning of July
- ▶ Install with:

```
> install.packages("PerformanceAnalytics")
```
- ▶ Required packages include Hmisc, zoo, and Rmetrics packages such as fExtremes.
- ▶ Load the library into your active R session using:

```
> library("PerformanceAnalytics").
```

Load and Review Data.

```
> data(managers)
> head(managers)
```

Set Up Data for Analysis.

```
> dim(managers)
[1] 132 10
> managers.length = dim(managers)[1]
> colnames(managers)
[1] "HAM1"          "HAM2"          "HAM3"          "HAM4"          "HAM5"
[6] "HAM6"          "EDHEC LS EQ" "SP500 TR"     "US 10Y TR"    "US 3m TR"
> manager.col = 1
> peers.cols = c(2,3,4,5,6)
> indexes.cols = c(7,8)
> Rf.col = 10
> #factors.cols = NA
> trailing12.rows = ((managers.length - 11):managers.length)
> trailing12.rows
[1] 121 122 123 124 125 126 127 128 129 130 131 132
> trailing36.rows = ((managers.length - 35):managers.length)
> trailing60.rows = ((managers.length - 59):managers.length)
> #assume contiguous NAs - this may not be the way to do it na.contiguous
> frInception.rows = (length(managers[,1]) -
+ length(managers[,1][!is.na(managers[,1])])) + 1:length(managers[,1])
```

Draw a Performance Summary Chart.

```
> charts.PerformanceSummary(managers[, c(manager.col, indexes.cols)],  
+ colorset=rich6equal, lwd=2, ylog=TRUE)
```

Show Calendar Performance.

```
> t(table.CalendarReturns(managers[,c(manager.col,indexes.cols)]))
```

Compare Distributions.

```
> chart.Boxplot(managers[ trailing36.rows, c(manager.col, peers.cols,
+ indexes.cols) ], main = "Trailing 36-Month Returns")
```

Compare Distributions.

```
> layout(rbind(c(1,2),c(3,4)))  
> chart.Histogram(managers[,1,drop=F], main = "Plain", methods = NULL)  
> chart.Histogram(managers[,1,drop=F], main = "Density", breaks=40,  
+ methods = c("add.density", "add.normal"))  
> chart.Histogram(managers[,1,drop=F], main = "Skew and Kurt", methods = c  
+ ("add.centered", "add.rug"))  
> chart.Histogram(managers[,1,drop=F], main = "Risk Measures", methods = c  
+ ("add.risk"))
```

Show Relative Return and Risk.

```
> chart.RiskReturnScatter(managers[trailing36.rows,1:8], Rf=.03/12, ma  
+ "Trailing 36-Month Performance", colorset=c("red", rep("black",5), "  
+ "green"))
```

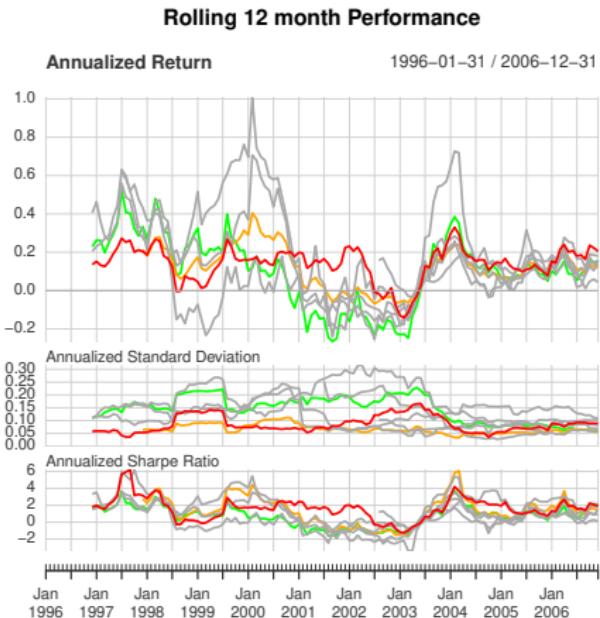

Calculate Statistics.

```
> table.Stats(managers[,c(manager.col,peers.cols)])
```

Kurtosis	2.3616	2.3794	2.6829	0.8632	2.3143	-0.3489

Examine Performance Consistency.

```
> charts.RollingPerformance(managers[, c(manager.col, peers.cols,
+ indexes.cols)], Rf=.03/12, colorset = c("red", rep("darkgray",5), "orange",
+ "green"), lwd = 2)
```

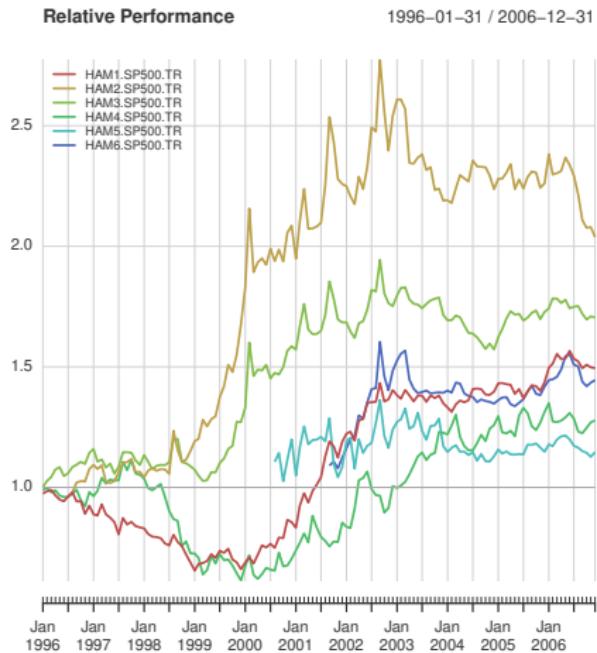

Display Relative Performance.

```
> chart.RelativePerformance(managers[, manager.col, drop = FALSE],  
+ managers[, c(peers.cols, 7)], colorset = tim8equal[-1], lwd = 2, le  
+ = "topleft")
```

Compare to a Benchmark.

```
> chart.RelativePerformance(managers[, c(manager.col, peers.cols) ],  
+ managers[, 8, drop=F], colorset = rainbow8equal, lwd = 2, legend.loc  
+ "topleft")
```

Compare to a Benchmark.

```
> if(requireNamespace("RobStatTM", quietly = TRUE)) { # CRAN requires conditional execution
+   table.CAPM(managers[trailing36.rows, c(manager.col, peers.cols)], managers[ trailing36.rows, ])
```

table.CAPM underlying techniques

- ▶ `Return.annualized` — Annualized return using

$$\text{prod}(1 + R_a)^{\frac{\text{scale}}{n}} - 1 = \sqrt[n]{\text{prod}(1 + R_a)^{\text{scale}}} - 1 \quad (1)$$

- ▶ `TreynorRatio` — ratio of asset's Excess Return to Beta β of the benchmark

$$\frac{(R_a - R_f)}{\beta_{a,b}} \quad (2)$$

- ▶ `ActivePremium` — investment's annualized return minus the benchmark's annualized return
- ▶ `Tracking Error` — A measure of the unexplained portion of performance relative to a benchmark, given by

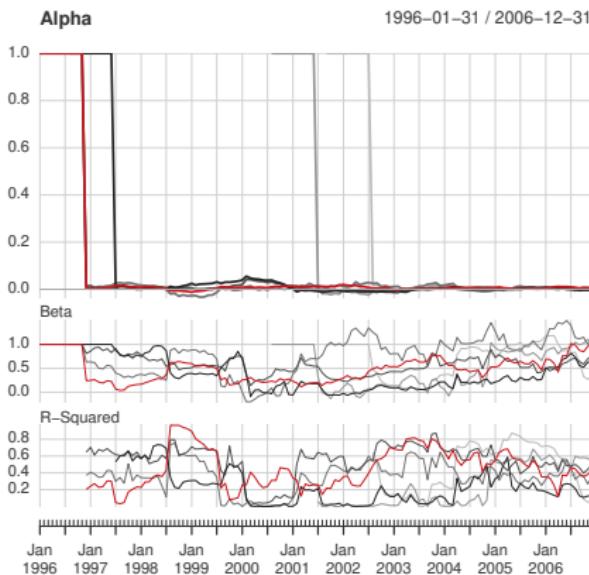

$$\text{TrackingError} = \sqrt{\sum \frac{(R_a - R_b)^2}{\text{len}(R_a) \sqrt{\text{scale}}}} \quad (3)$$

- ▶ `InformationRatio` — `ActivePremium/TrackingError`

Compare to a Benchmark.

```
> #source("PerformanceAnalytics/R/Return.excess.R")
> charts.RollingRegression(managers[, c(manager.col, peers.cols), drop
+ FALSE], managers[, 8, drop = FALSE], Rf = .03/12, colorset = redfocu
+ 2)
```

Rolling 12-month Regressions

Calculate Downside Risk.

```
> table.DownsideRisk(managers[,1:6], Rf=.03/12)
```

	HAM1	HAM2	HAM3	HAM4	HAM5
Semi Deviation	0.0191	0.0201	0.0237	0.0395	0.0324

Historical ES (95%)	-0.0513	-0.0331	-0.0555	-0.1122	-0.1023
Modified VaR (95%)	-0.0342	-0.0276	-0.0368	-0.0815	-0.0676
Modified ES (95%)	-0.0610	-0.0614	-0.0440	-0.1176	-0.0974

Semivariance and Downside Deviation

- Downside Deviation as proposed by Sharpe is a generalization of semivariance which calculates bases on the deviation below a Minimumn Acceptable Return(MAR)

$$\delta_{MAR} = \sqrt{\frac{\sum_{t=1}^n (R_t - MAR)^2}{n}} \quad (4)$$

- Downside Deviation may be used to calculate semideviation by setting $MAR=\text{mean}(R)$ or may also be used with $MAR=0$
- Downside Deviation (and its special cases semideviation and semivariance) is useful in several performance to risk ratios, and in several portfolio optimization problems.

Value at Risk

- ▶ Value at Risk (VaR) has become a required standard risk measure recognized by Basel II and MiFID
- ▶ traditional mean-VaR may be derived historically, or estimated parametrically using

$$z_c = q_p = qnorm(p) \quad (5)$$

$$VaR = \bar{R} - z_c \cdot \sqrt{\sigma} \quad (6)$$

- ▶ even with robust covariance matrix or Monte Carlo simulation, mean-VaR is not reliable for non-normal asset distributions
- ▶ for non-normal assets, VaR estimates calculated using GPD (as in VaR.GPD) or Cornish Fisher perform best
- ▶ modified Cornish Fisher VaR takes higher moments of the distribution into account:

$$z_{cf} = z_c + \frac{(z_c^2 - 1)S}{6} + \frac{(z_c^3 - 3z_c)K}{24} + \frac{(2z_c^3 - 5z_c)S^2}{36} \quad (7)$$

$$modVaR = \bar{R} - z_{cf} \sqrt{\sigma} \quad (8)$$

- ▶ modified VaR also meets the definition of a coherent risk measure per Artzner,et.al.(1997)

Risk/Reward Ratios in *PerformanceAnalytics*

- ▶ SharpeRatio — return per unit of risk represented by variance, may also be annualized by

$$\frac{\sqrt[n]{\text{prod}(1 + R_a)^{\text{scale}}} - 1}{\sqrt{\text{scale}} \cdot \sqrt{\sigma}} \quad (9)$$

- ▶ Sortino Ratio — improvement on Sharpe Ratio utilizing downside deviation as the measure of risk

$$\frac{(\overline{R_a} - \text{MAR})}{\delta_{\text{MAR}}} \quad (10)$$

- ▶ Calmar and Sterling Ratios — ratio of annualized return (Eq. 1) over the absolute value of the maximum drawdown
- ▶ Sortino's Upside Potential Ratio — upside semdeviation from MAR over downside deviation from MAR

$$\frac{\sum_{t=1}^n (\overline{R_t} - \text{MAR})}{\delta_{\text{MAR}}} \quad (11)$$

- ▶ Favre's modified Sharpe Ratio — ratio of excess return over Cornish-Fisher VaR

$$\frac{(\overline{R_a} - \overline{R_f})}{\text{modVaR}_{R_a,p}} \quad (12)$$

- ▶ **NOTE:** The newest measures such as modified Sharpe and Sortino's UPR are far more reliable than older measures, but everyone still seems to look at older measures.

Summary

- ▶ Performance and Risk analysis are greatly facilitated by the use of charts and tables.
- ▶ The display of your information is in many cases as important as the analysis.
- ▶ The observer should have gained a working knowledge of how specific visual techniques may be utilized to aid investment decision making.
- ▶ Further Work
 - ▶ Additional parameterization to make charts and tables more useful.
 - ▶ Pertrac or Morningstar-style sample reports.
 - ▶ Functions and graphics for more complicated topics such as factor analysis and optimization.
